

**COMS21202: Symbols, Patterns and Signals****Problem Sheet 1: Data Acquisition**

1. On the  $\sin(x)$  signal below, label the following terms and approximate their values: period, frequency and amplitude

**Answer:**

*period = 1.57 seconds*

*frequency = 0.6 [note that we did not label frequency as it is equal to  $1/\text{period}$ ]*

*amplitude = 0.3*

2. For the signal above, convert the signal into its digital representation using the sampled points. You need to think about the number of bits you would represent each sample as. This is referred to as **Quantisation**. Example, if you need 8 different levels of sound, then 3 bits are sufficient ( $2^3 = 8$ ).

**Answer:**

*Assuming we use 8 levels of sound that correspond to the horizontal grid lines, then each sample is approximated by the binary representation of the closest (rounding) vertical line. The digitisation would thus be:*

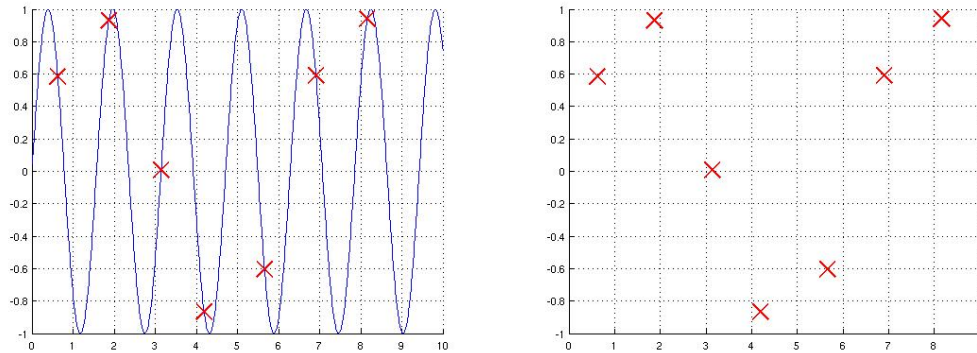

*100 001 111 010 011 111 001 101 110 001 110 (11 in total each corresponding to a sampling point as above)*

What is the sampling rate in this case??

**Answer:**

*Sampling rate is 1 Hz (1 sample per second)*

3. Repeat the digitization and reconstruction step for this data below, can you notice any difference?

**Answer:**

*Follow the example above again...*

4. Based on your understanding of the **Nyquist Sampling Rate** theorem, what is a sufficient sampling rate for the signal below?

Note: You might want to look at Fourier Analysis to understand how was this sinusoidal wave constructed.

**Answer:**

*The figure above shows the waves  $\sin(x)$  and  $\sin(2x)$  and the sum of the two waves*

*When adding the summed wave  $\sin(x) + \sin(2x)$  to the higher frequency wave  $\sin(3x)$  then the wave to the right results*

*Next we add  $\sin(x) + \sin(2x) + \sin(3x)$  to  $\sin(10x)$  resulting in the frequency required.*

*The highest frequency in the figure is thus that of the wave  $\sin(10x)$ . The frequency is thus  $\frac{10}{2\pi} = 1.59$  Hz. Following the Nyquist theorem the sampling rate should be at least 3.18 Hz ( $2 \times 1.59$ ).*

## 5. Refreshing your memory:

For the set of measurements:

-3, 2, 4, 6, -2, 0, 5

calculate:

mean

median

variance

standard deviation

**Answer:**

*mean = 1.7*

*median = 2*

*variance = 12.2*

*standard deviation = 3.5*

6. **Distance measures:** Calculate the following distance measures for the data provided:

- $D1 = (4,5,6)$ ,  $D2 = (2, -1, 3)$  - Distance Measure Manhattan Distance  $L_1$
- $D1 = (4,5,6)$ ,  $D2 = (2, -1, 3)$  - Distance Measure 3-norm  $L_3$
- $D1 = (4, 5, 6)$ ,  $D2 = (2, -1, 3)$  - Distance Measure Chebyshev Distance  $L_\infty$
- $D1 = \text{'water'}$ ,  $D2 = \text{'further'}$  - Distance Measure Edit Distance
- $D1 = \text{'weather'}$ ,  $D2 = \text{'further'}$  - Distance Measure Hamming Distance
- Order, ascendingly, the following words  $\{\text{'tap'}$ ,  $\text{'river'}$ ,  $\text{'liquid'}$ ,  $\text{'ice'}\}$  based on their WUP relatedness to:  $\text{'water'}$ . Use 1-WUP as the distance measure and the online <http://ws4jdemo.appspot.com>

**Answer:**

- 11
- 6.3
- 6
- 4
- 3
- $WUP(\text{'water'}, \text{'ice'}) = 0.67$ ,  $WUP(\text{'water'}, \text{'tap'}) = 0.8$ ,  $WUP(\text{'water'}, \text{'river'}) = 0.83$ ,  $WUP(\text{'water'}, \text{'liquid'}) = 0.94$   
 $D(\text{'water'}, \text{'ice'}) = 0.33$ ,  $D(\text{'water'}, \text{'tap'}) = 0.2$ ,  $D(\text{'water'}, \text{'river'}) = 0.17$ ,  $D(\text{'water'}, \text{'liquid'}) = 0.06$   
 $Order = \{\text{'liquid'}$ ,  $\text{'river'}$ ,  $\text{'tap'}$ ,  $\text{'ice'}\}$

7. **Distance measures:** Assume you were given a set of whatsapp messages, each with a times-tamp (yy-mm-dd hh:mm) and text content (word, word, ...). Propose a distance measure for:

- calculating whether one message is an exact forward of the other message
- calculating whether one message was sent before the other message
- calculating whether one message contains the same set of words as the other message
- calculating whether one message contains the other message (with potential extras at the start and the end)
- calculating whether both messages discuss the same topic

Check your distance measures satisfy: non-negativity, reflexive, symmetric and triangle inequality.

**Answer:**

- (a) Calculate the Edit distance (or the Hamming if they have the same length).
- (b) Calculate the difference in the number of minutes relative to a suitable starting 0 time.
- (c) You might wish to propose to use

$$D_{NS}(WTS_1, WTS_2) = \sum_i \min_j \text{hamming}(w_{1i}, w_{2j}) \quad (1)$$

but this is not symmetric. One way to make it symmetric is to

$$D_S(WTS_1, WTS_2) = D_{NS}(WTS_1, WTS_2) + D_{NS}(WTS_2, WTS_1) \quad (2)$$

- (d) You can use dynamic time warping.
- (e) You can use a semantic distance measure between words like WUP, where

$$D(WTS_1, WTS_2) = \sum_i \min_j D_{WUP}(w_{1i}, w_{2j}) + \sum_i \min_j D_{WUP}(w_{2i}, w_{1j}) \quad (3)$$
